

PHANTOM SCREENS™

[September 2017](#)

Including Door and Window Treatments in The Build Process

You've designed a large glazed opening to better connect indoors and outdoors. You want to make the most of the view and maximise light, and glass is key to delivering it. So, what about privacy and solar management?

If you've looked into curtains and blinds, you've probably realised that they are impractical for bifold doors, not to mention a little dated. There are other options, such as thermochromic glass, but this doesn't allow for ventilation, and you would prefer the option to let in fresh air. For renovators and home builders who are looking for the ideal way to screen large, glazed areas – Phantom Screens has the solution.

Book an on-site consultation with us at build stage, and we'll show you how to incorporate screening solutions in the build. Our customers tell us they get great value from our consultations and have made better decisions on the effectiveness of their build as a result.

[Fully Recessed to Disappear from View](#)

Phantom Power Screens are designed to fully recess from view when retracted to ensure minimal impact on architectural design. They can be finished in any RAL colour, so you get an invisible built-in

privacy and solar management solution. Our remote-control powered screens are designed for openings up to 12m wide and can link to home automation systems.

By incorporating screening solutions into the design of new build projects, you can include the outdoors seamlessly into the sequence of home spaces - maximising the surroundings and extending enjoyment of summer evenings without solar glare, heat build-up, or the intrusion of nuisance insects.

Screening for Environment and Climate Management

Screening is playing an increasingly central role in the management of light and the reduction of thermal gain in building design. The use of screens can vastly improve the interior climate and reduce environmental impact.

Thermal comfort gains are made by retaining heat in the evenings while deflecting energy during the day - helping to improve SAP ratings. A range of technical meshes is available, including solar shading, privacy screens, and fine meshes for insect-free ventilation. Optional sun and wind sensors can automatically adjust screen position, giving you even more control.

High Quality UK Manufacture

Phantom solar and insect screens have been the preferred solution in Canada and the USA for many decades. As the sole UK distributor, we manufacture in the UK to the highest quality standards with the same level of attention and consideration that the US market has come to expect. A Limited Lifetime Warranty is offered on all screens, backed up by exceptional care and customer service.

Our customers – both self-builders and architects – are shifting the way they think about living space, redefining the home dynamic that comes from connecting interior and exterior landscapes, something that to date has only been accessible to a minority.

Get in touch with us today to talk about your project or book a free on-site consultation.
